Idea in motion!

ERGOSTOP®

Innovative Brake System for Employee Well-Being

The wheels on 4-wheeled containers are notorious for having a mind of their own. Traditional brakes are connected to the castors following the orientation of the castors, often ending up below the container, making them difficult for waste collectors to access.

This requires repositioning by using the feet and leads to high wear on safety shoes and triggers ergonomic health risks due to the repetitive loads on the feet and knees.

At ESE, we're not just building products; we're shaping healthier, more sustainable workplaces.

ESE has developed an innovative braking system. With ERGOSTOP® the brakes are always accessible in the front providing a safe working environment.

ESE commits to designing and developing products that prioritize the well-being and health of their users.
